How to use Snowflake SQL from VS Code?

Antti Rask

2026-04-16

Disclaimers:

- made with/for PC and Windows 11
- all opinions (and mistakes) are mine

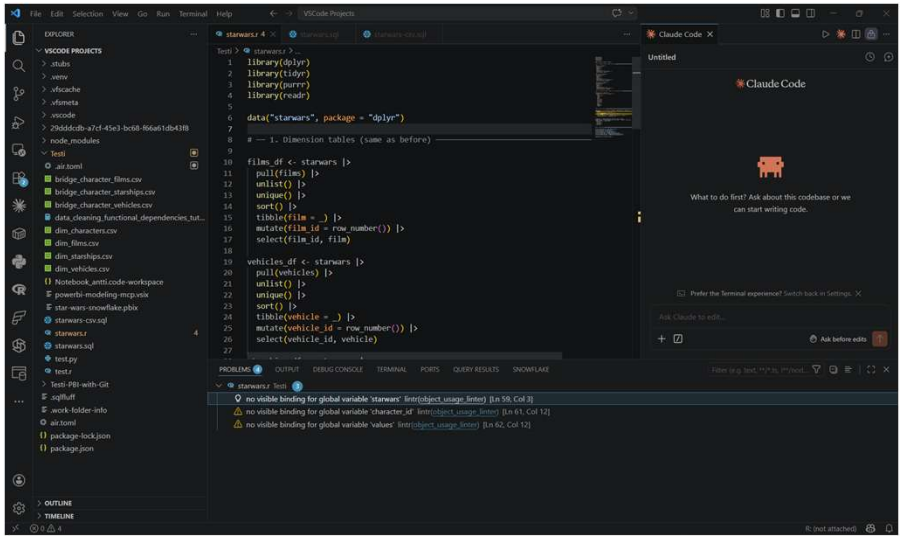
VSCode vs. Snowsight

VSCode vs. Snowsight

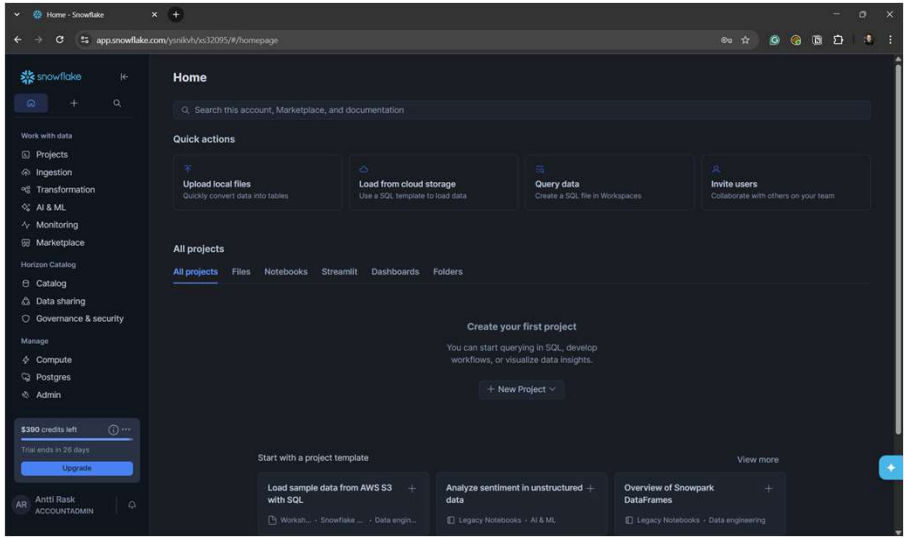
- This presentation was first made a year ago and was called Why use Snowflake SQL from VS Code (instead of Snowsight)?
- A lot has changed since that, mainly the Workspaces feature in Snowsight, which bridged the gap significantly
- Now it’s more about personal preference, but there are still some differences between the two features-wise

VSCode vs. Snowsight

VSCode (a.k.a. Visual Studio Code)



Snowsight



Editing

Feature	VSCode	Snowsight
SQL linting & formatting	Full control with **sqlfluff**, for instance	Built-in Format SQL (Workspaces only, limited style rules)
Regex search & replace	Multi-file (with Ctrl + Shift + F)	Within a single file

File & Project Management

Feature	VSCode	Snowsight
Queries as .sql files	Native, any file system structure	File-based in Workspaces, but stored in Snowflake's system
Folder organisation	Full OS file system, unlimited nesting	Folders supported in Workspaces
Share queries with team	Via Git / any file sharing	Shared workspaces with role-based access, within Snowflake org only
Works offline	Yes, edit without a connection (of course running a query requires a connection)	Browser-only, requires a connection

Results & Comparison

Feature	VSCode	Snowsight
Open results in new tab	Yes	Results stay in same worksheet pane
Export results	Direct to file system	Download CSV/JSON from UI
Column stats / data profiling	Not built in	Inline histograms, sum/avg per column
Query profile	Not available	Visual execution plan with node-by-node breakdown

Workflow & History

Feature	VSCode	Snowsight
Extensions / plugins	Vast ecosystem: linters, dbt, AI, any database	No extension model, but deep native integrations (dbt, Snowpark, Streamlit, Cortex AI)
AI coding assistant	GitHub Copilot, Cursor, Continue, etc.	Snowflake Copilot (native, schema-aware, improving)
Keyboard-first workflow	Command palette, full shortcut customisation	Improved with Monaco (open-sourced VSCode editor engine), mouse still needed more often

The one big thing that is still only available in Snowsight: Query Profile

What if I want to see the Query Profile?

```
Execute
SET character_name = 'Luke Skywalker';

Execute
WITH film_list AS (
    SELECT
        bf.character_id,
        ARRAY_AGG(f.film) AS films
    FROM starwars.public.bridge_character_films bf
    INNER JOIN starwars.public.dim_films f ON bf.film_id = f.film_id
    GROUP BY bf.character_id
),

vehicle_list AS (
    SELECT
        bv.character_id,
        ARRAY_AGG(v.vehicle) AS vehicle
    FROM starwars.public.bridge_charact
    INNER JOIN starwars.public.dim_vehi
    GROUP BY bv.character_id
),

starship_list AS (
    SELECT
        bs.character_id,
        ARRAY_AGG(s.starship) AS starships
```

1. Get the Query ID

PROBLEMS 4 | OUTPUT | DEBUG CONSOLE | TERMINAL | PORTS | QUERY RESULTS | SNOWFLAKE

QUERY RESULTS

Table | Chart

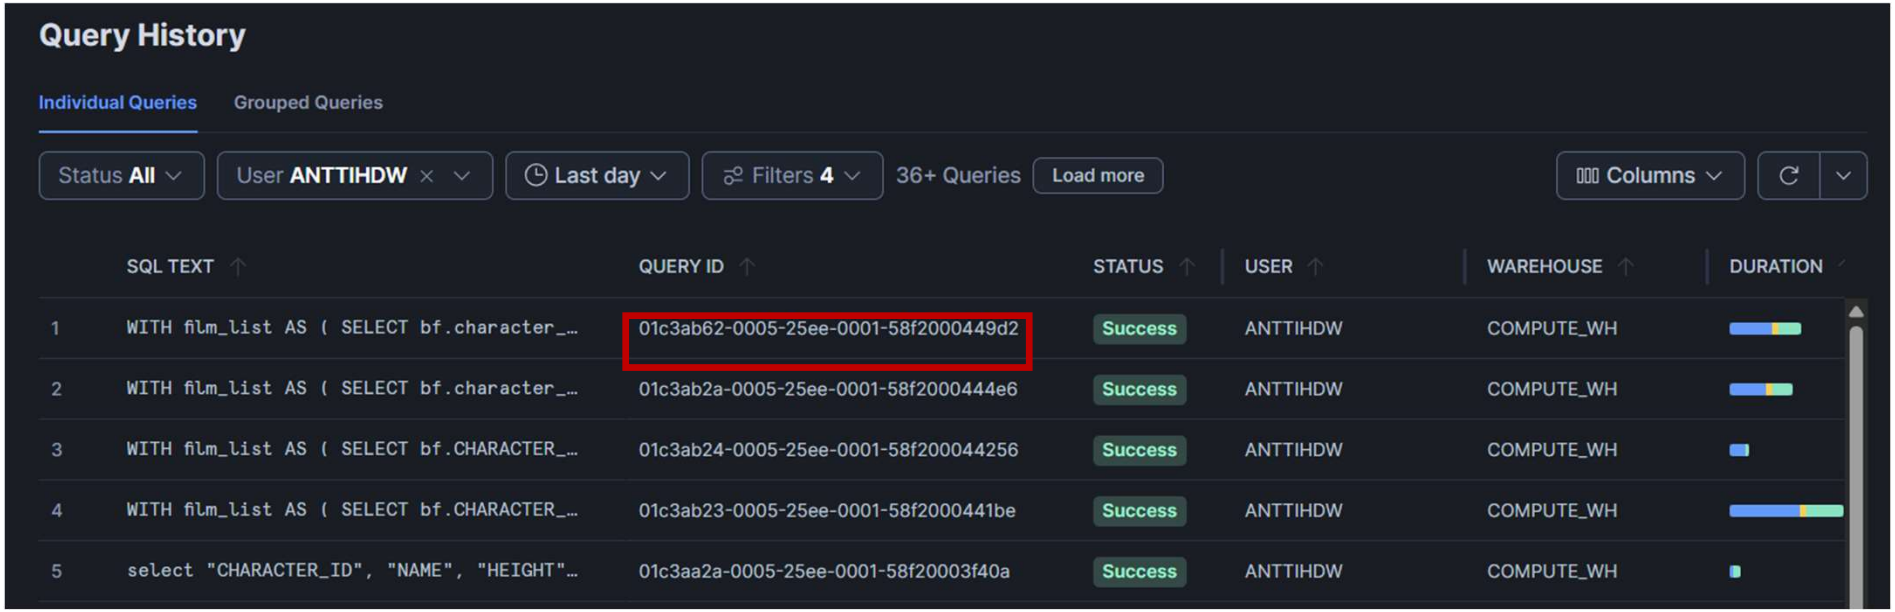
	NAME	HEIGHT	MASS	HAIR_COLOR	SKIN_COLOR	EYE_
1	Luke Skywalker	172	77	blond	fair	blue

Query Details

01c3ab62-0005-25ee-0001-58f2000449d2

Query Duration	857ms
Rows	1
End time	Mon Apr 13 2026
Scanned	11.5KB (100%)
Role	ACCOUNTADMIN
Warehouse	COMPUTE_WH

What if I want to see the Query Profile?



2. Open Snowsight

3. Find the query with a matching Query ID

4. Click on the Query ID

How to start using Snowflake SQL inside VS Code?

Setting up

1. Install Visual Studio Code (VSCode)
2. Open VSCode
3. Open Extensions (Ctrl + Shift + X) and install the following:
   - Snowflake
   - Snowflake VSCode
     - Not mandatory, but “will highlight keywords and functions for the Snowflake flavor of SQL in VS Code”
   - sqlfluff
     - Not mandatory, but it’s a “linter and auto-formatter for SQLfluff, a popular linting tool for SQL and dbt”
     - You need to also install SQLfluff (with Python)

Connecting to Snowflake

1. Click the Snowflake Icon on the activity bar
2. From the Account dropdown
   - Add Account Identifier
     - Run SELECT CURRENT_ORGANIZATION_NAME() || '-’ || CURRENT_ACCOUNT_NAME(); in Snowsight to get the ID
   - Auth Method: Depends on your account/organization
     - I’m using Username/Password with this Free trial account, but for my work account I used Single Sign-On

Demo time!
